ENHANCING PRACTICE IN CHRONIC PULMONARY CONDITIONS

Our 20 credit masters-level module will prepare you for ethical practice within the field of chronic pulmonary conditions, namely chronic obstructive pulmonary disease and asthma. The evaluation of a number of interventions, for example, self-efficacy, health promotion, pharmacological, education and exercise, will be strongly emphasised to enhance the basis for clinical reasoning and decision making.

The module will cover:

• Discussion and debate on the best practice of managing people with long-term pulmonary conditions.

• Designing, implementing and evaluating health and social care services and rehabilitation for people with a long-term respiratory condition.

• Health behaviour concepts, models and theories for lifestyle modification.

• Evidence-based best practice from acute to long-term management.
